Title: LoneWolf - Live people connection

Submitted by: Niv Horwitz & Niv Badichi

Abstract: LoneWolf is a city-based social activity platform that helps individuals discover, create, and join real-world events happening around them. The system is built for people who want to explore new experiences, meet others with shared interests, and take part in group activities across the city. Users can quickly browse events on a dynamic map, join activities that fit their schedule, or host their own events for others to participate in such as recreational activities, meet & greet, or even brain storming business ideas. LoneWolf emphasizes comfort, openness, and low social pressure, aiming to make it easy for people to connect through shared activities rather than personal matching or profiles.

key features:

User interface: A simple, intuitive interface that enables users to:

- Create a personal profile with interests.
- View nearby activities through an interactive map.
- Browse an organized feed of upcoming events.

Event management: Tools allowing smooth creation and handling of events:

- Create a new event in seconds with title, time, location, and category.
- Pick the event location directly from the map.
- Update or cancel events, with automatic notifications to attendees.

Location services: Integrated mapping capabilities for:

- Real-time geolocation and event discovery.
- Visual markers (pins) representing activity hotspots.

Real-time notifications updates including:

- Event reminders and arrival-time alerts.
- Changes in time, location, or capacity.

LoneWolf streamlines how people find and participate in city-based activities. By focusing on shared experiences rather than personal matchmaking, the system reduces friction and encourages natural, relaxed interaction among participants. With a map-driven interface, quick event creation, and smart discovery tools, LoneWolf delivers a scalable and efficient platform for anyone looking to engage with their city and meet others through meaningful activities.
